

Project Proposal: Automated Client Document Generator

Dinesh Bala S
Date: 24th Sept 2025

Dear Zoya,

It was great speaking with Ms. Kumaravel about the challenges your team faces with document creation. I specialize in developing custom automation tools, and this project aligns perfectly with my experience in backend development and creating solutions for similar projects. I've prepared the following proposal to outline how we can build this for you

Project Understanding : As I understand it, your team's current process for creating presentations is manually intensive, consuming significant time and preventing progress on other important projects. The primary goal of this tool is to automate this entire workflow, reducing the time it takes to generate a client-ready PowerPoint from hours to just a few minutes.

Project Solution : I will develop a self-contained web application using Python and the **Flask** framework. The application will feature a minimal, user-friendly interface where team members can input their presentation details and generate a complete PowerPoint presentation with a single click. To handle images, the tool will integrate directly with an **Image API**, allowing users to add high-quality visuals simply by searching or pasting a URL. This solution is designed to reduce the PPT creation time from hours to minutes.

Scope of Work

To ensure clarity and a successful project, the following list outlines the specific deliverables and services included in this proposal.

Included in this Project:

- **A Standalone Web Application:** Development of a web application using Python and the Flask framework, accessible via a web browser.
- **Minimal User Interface (UI):** A clean and simple web page with input forms for all the necessary text fields for the presentation.
- **PowerPoint Template Integration:** The backend will be built to populate **one (1)** master PowerPoint template, which you will provide.
- **Image Sourcing via API:** Integration with a **single, agreed-upon Image API** (e.g., Pexels, Unsplash, Google street API or a key you provide) to search for and embed images. I'm hoping the key will be provided in advance.

- **Document Generation:** A function to process the user's input and generate a final, populated `.pptx` file.
- **Download Functionality:** A 'Download' button to allow users to save the generated presentation to their computer.
- **Cloud Deployment:** The final, approved application will be deployed to a cloud service (e.g., Render or similar PaaS) for your team's use.
- **Two Rounds of Revisions:** I will deliver the first version of the tool for your review, and this scope includes Two rounds of feedback and minor adjustments.

Not Included in this Project (Out of Scope):

- **Creation of the PowerPoint Template:** The master `.pptx` template must be provided by your team.
- **Support for Multiple Templates:** This scope covers one template. Adding more templates would require a separate discussion and quote.
- **Advanced UI/UX Design:** The focus is on a functional, minimal UI. Custom branding or complex design is not included.
- **User Accounts or Logins:** The application will be a simple, open tool for your team. It will not include individual user accounts or permissions.
- **Ongoing Maintenance & Support:** This project covers the development and deployment of the tool. Long-term support or adding new features in the future can be arranged under a separate maintenance agreement.

Project Timeline

I am confident this project can be completed within a focused **2-week (10 working days)** timeframe. Throughout this process, I will collaborate closely with **Ms. Kumaravel**, incorporating her feedback to ensure the final tool perfectly meets your team's needs.

The project will be structured into two distinct phases:

Week 1: Core Development & Functional Prototype

The first week is dedicated to building and delivering a working version of the tool for initial review.

- **Kick-off & Requirements:** I will start by confirming the final requirements and receiving the master PowerPoint template from Ms. Kumaravel.
- **Rapid Development:** I will immediately begin building the core application, including the user interface, the PowerPoint generation logic, and the image API integration.

- **Prototype Delivery:** By the end of this week, I will deploy a functional prototype to a private server for Ms. Kumaravel to test and review.

Week 2: Revisions & Final Deployment

The second week is focused on refining the tool based on feedback and delivering the final product.

- **Feedback Implementation:** I will incorporate the revisions and adjustments requested by Ms. Kumaravel.
- **Final Testing:** I will conduct a final round of testing to ensure the application is robust and bug-free.
- **Final Deployment:** Once approved, I will deploy the finished tool to your designated PaaS account, which you will provide access to.
- **Project Hand-off:** I will conduct a final walkthrough with Ms. Kumaravel and formally hand over the completed project.

***Disclaimer:** This accelerated 2-week timeline is dependent on the timely provision of the template and any necessary credentials, as well as prompt feedback during the review phase.*

Project Investment & Payment Terms

The total fixed cost for this project is **\$500 USD**. To ensure a committed and collaborative partnership, the payment will be structured based on the following project milestones:

- **50% (\$250)** payable upon delivery of the functional prototype at the end of Week 1.
- **50% (\$250)** due upon final project approval and hand-off.

Next Steps

I am confident this tool will provide significant value to your team. If the terms outlined in this proposal are agreeable, we can proceed with the project.

I look forward to your confirmation so we can begin the project at your earliest convenience.
